Voice of Customer: Credit-Reporting Friction

Michael Farzinpour | Public CFPB complaint metadata | Retrieved October 3, 2026

Finding: Report accuracy led 9,634 credit-reporting complaints: 5,007 (52.0%). Of those, 2,820 concerned information belonging to someone else. Prioritize an accuracy-resolution diagnostic, then check the pattern against other dates and operational case records.

Source, scope, and theme measurement

Official filtered CSV export: all 9,634 published records received September 3, 2024 for the credit-reporting product; 9,634 unique IDs. No company, issue, geography, or response filters. Map eight consumer-selected issue labels to six themes and preserve originals for audit. This complete one-day extract is not representative of customers or all dates.

Reported friction theme	Complaints	Share of 9,634
Report accuracy	5,007	52.0%
Report use and unrecognized inquiries	2,700	28.0%
Dispute investigation	1,795	18.6%
Monitoring and identity protection	78	0.8%
Report access	30	0.3%
Fraud alerts and security freezes	24	0.2%

Reported categories do not establish root causes. No narrative, sentiment, or AI theming was performed. Response categories do not establish satisfaction or customer-confirmed resolution.

Proposed pilot and accountable ownership

Weeks 1-2: Insights + Operations review accuracy disputes, evidence requests, and handoffs. Week 3: Product, Service, and Compliance agree on a permitted change, owner, baseline, and success threshold. Weeks 4-6: test clearer evidence prompts and case status; review barriers weekly. Potential harm can override frequency-based priority.

AI assisted triage and quality evaluation

Propose a human-reviewed AI assistant for authorized operational case text, using structured-label/manual routing as the baseline. Evaluate held-out, expert-adjudicated cases against a rubric: correct theme and route, urgent-case escalation, source-grounded statements, and uncertainty handling. Track routing precision/recall, missed escalations, human corrections, and handling time in shadow mode before a limited pilot.

Measure customer outcomes and close the loop

Primary: repeat contacts per eligible dispute in 30 days. Secondary: customer-confirmed resolution time, reopened cases, post-resolution CSAT with response coverage, and effort feedback (CES-style). Guardrails: compliance defects and human-help access. These proposed outcomes require additional operational data.

Insight-to-Action Rate: priority themes with launched interventions / accepted priority themes. **Time-to-Action:** median acceptance-to-launch days. **Action Closure Rate:** actions due and closed with documented outcomes / all actions due. Owners and deadlines are proposed; no implementation or improvement is claimed.

Provenance and limits

Frozen records, exact mapping, export checksum, counts, Python analysis, and proposed AI evaluation rubric accompany the case. Conclusions apply to this one-day snapshot. No intervention or AI model was implemented, and no customer improvement is claimed.
